DETD(191)

Amplification of \*\*HBV\*\* from Serum

DETD(DESC):

DETD(192)

DNA surrounded by proteins -- in this case viral hepatitis B DNA -- was efficiently \*\*detected\*\* after amplification by means of an appropriate buffer according to Example 10 for the amplification of purified DNA in the presence of serum. To this end, a serum having an \*\*HBV\*\* count of  $1.5 \times 10^7$  HB viruses per microlitre (determination of count by means of the Abbott test No. 2022: \*\*Kit\*\* for viral \*\*HBV\*\*-DNA \*\*detection\*\* and quantification) after different dilution, was amplified in control serum with \*\*HBV\*\* specific primers MD122 and MD123. 10  $\mu$ l of serum were denatured in 50  $\mu$ l of reaction volume with L5 buffer and after addition of the PCR mix, amplified for 40 cycles. The products were analyzed on agarose gel. The results are summarized below in Table 12.

#### ABSTRACT:

The present invention relates to a method for the \*\*detection\*\* in body fluids of antibodies to hepatitis C virus (HCV), also known as a non-A non-B hepatitis (NANBH) virus and to the diagnosis of NANBH by the use of a composition of synthetic peptides. Each of these peptides has an amino acid sequence corresponding to immunodominant regions of a fusion protein and a non-structural polypeptide of HCV, SOD/HCV C100 and a postulated HCV structural (core) protein. More specifically, the present invention is directed to the use of a group of synthetic peptides in a prescribed sequence or their analogues for the \*\*detection\*\* of antibodies to HCV in body fluids. The \*\*detection\*\* method includes an enzyme-linked immunosorbent assay (ELISA), and other forms of immunoassay procedures. The present invention also relates to a method for generating high titer antibodies to HCV in healthy mammals, including humans, by the use of compositions containing these synthetic peptides, analogues or mixtures thereof, in a free, conjugated or polymeric form as key components in

'synthetic vaccines for the prevention of non-A non-B hepatitis (NANBH).

#### ABSTRACT:

An analyte polynucleotide strand having an analyte sequence is  
 \*\*detected\*\* within a sample containing polynucleotides by contacting the  
 analyte polynucleotide with a capture \*\*probe\*\* under hybridization  
 conditions, where the capture \*\*probe\*\* has a first binding partner  
 specific for a solid-phase second binding partner. The resulting duplex  
 is then immobilized by specific binding between the binding partners, and  
 non-bound polynucleotides are separated from the bound species. The  
 analyte polynucleotide is optionally displaced from the solid phase, then  
 amplified by PCR. The PCR primers each have a polynucleotide region  
 capable of hybridizing to a region of the analyte polynucleotide, and at  
 least one of the primers further has an additional binding partner  
 capable of binding a solid-phase binding partner. The amplified product  
 is then separated from the reaction mixture by specific binding between  
 the binding partners, and the amplified product is \*\*detected\*\*.

#### ABSTRACT:

A **kit** and a method for performing a competitive immunoassay utilize nucleic acid **oligonucleotide** chains for the **detection** of analytes, such as drugs, substances of abuse, hormones, poisons, organic compounds, peptides, proteins and the like. The **kit** includes a hapten-**oligonucleotide** complex, a complementary **oligonucleotide** chain for conjugating with the hapten-**oligonucleotide** complex, an antibody specific for the hapten and a fluorescent label such as ethidium bromide having an affinity for nucleic acid duplexes formed from the hapten-**oligonucleotide** complex and the complementary **oligonucleotide** chain. A means for **detecting** the presence of the fluorescent label such as a U.V. transilluminator, U.V. lightbox and fluorescence spectrophotometer is utilized to **detect** color intensity and fluorescence of the dye. The method can be performed in solution, or on a solid "dipstick" on which the reagents for the immunoassay have been immobilized.

ABSTRACT:

Methods and compositions are provided for rapid \*\*detection\*\* of nucleic acid sequences. The method employs two reagent sets. The first set is a labelling set comprising: (1) a first nucleic acid sequence \*\*probe\*\* having an analyte complementary region and a first recognition sequence region and (2) a labelled sequence complementary to the first recognition sequence region. The second set is a capturing set comprising: (1) a second nucleic acid sequence \*\*probe\*\* having an analyte complementary region and a second recognition sequence region, (2) a specific binding pair member conjugated to a sequence complementary to the second recognition sequence, and (3) a separating means to which is bound a complementary specific binding pair member. The sample and probes are combined under annealing conditions, followed by addition of the other reagents, separation of the bound label from the supernatant and \*\*detection\*\* of the label in either phase.

#### ABSTRACT:

The present invention discloses a screening test for **\*\*detecting\*\*** the presence of contaminating or infectious agents causing non-A, non-B hepatitis or AIDS in a blood donor setting. A **\*\*kit\*\*** for the **\*\*detection\*\*** of contaminating agents belonging to the group of retroviruses is also disclosed. Screening blood or blood related products so as to prevent spreading of infection or contamination due to retroviruses is now made possible by the present invention.

ABSTRACT:

The herpes simplex virus encodes ICP4, a DNA binding protein. ICP4-binding duplexed structures having significantly enhanced stability under physiological conditions are described. The structures are provided in the form of polynucleotide conjugates capable of adopting a duplexed structure, in which annealable polynucleotide strands are coupled covalently at one or both ends through a chemical linker which establishes a stabilizing bridge between strands. The present polynucleotide conjugates have therapeutic utility against viral infection as the polynucleotide strands thereof define a binding site for a viral regulatory protein, thereby inactivating the protein and preventing viral replication from occurring.

#### ABSTRACT:

**\*\*Oligonucleotide\*\*** analogs having one or more substitute linkages of the  
 formula 2'/3'--S--CH.sub.2 --CH.dbd.5' or 2'/3'--O--CH.sub.2 --CH.dbd.5'  
 between adjacent nucleomonomers are disclosed. The substitute linkage  
 replace the usual phosphodiester linkage found in unmodified nucleic  
 acids. The **\*\*oligonucleotide\*\*** analogs are easy to synthesize, stable in  
 vivo, resistant to endogenous nucleases and are able to hybridize to  
 target nucleic acid sequences in a sequence specific manner.

#### ABSTRACT:

Novel methods for assaying a nucleic acid analyte are provided, which employ polynucleotides having \*\*oligonucleotide\*\* sequences substantially homologous to a sequence of interest in the analyte, where the presence or absence of hybridization at a predetermined stringency provides for the release of a label from a support. Particularly, various techniques are employed for binding a label to a support, whereupon cleavage of either a single or double strand, a label may be released from a support, where the release of the label can be \*\*detected\*\* as indicative of the presence of a particular \*\*oligonucleotide\*\* sequence in a sample. The method finds use in diagnosis of disease, genetic monitoring, and analysis of nucleic acid mixtures.

## ABSTRACT:

The invention relates to novel **\*\*oligonucleotides\*\***, the process for their preparation and their biological uses as mediators of the action of interferon. The **\*\*oligonucleotides\*\*** according to the invention have the formula: ##STR1## in which Y and T are identical or different and represent particularly O, S, Z and W are identical or different and represent particularly O, S, one at least of the elements Y and Z being different from oxygen, X represents particularly --CHOHCH.sub.2 OH, .SIGMA. is a whole number equal to or greater than 2, A represents adenine or one of its derivatives. These **\*\*oligonucleotides\*\*** have antiviral use.

Evidence for involvement of a ribosomal leaky scanning mechanism in the translation of the hepatitis B virus \*pol\* gene from the viral pregenome RNA.

Lin CG; Lo SJ  
Graduate Institute of Microbiology and Immunology, National Yang-Ming Medical College, Taipei, Taiwan, Republic of China.

Virology (UNITED STATES) May 1992, 188 (1) p342-52, ISSN 0042-6822

JOURNAL ANNOUNCEMENT: 9207

Subfile: INDEX MEDICUS

In retroviruses, the \*pol\* gene is expressed in the form of a gag-\*pol\* fusion protein by the mechanism of ribosomal frameshifting. In studies of the possible mechanism of hepadnaviral \*pol\* protein synthesis, recent results have ruled out \*core\*-\*pol\* fusion protein synthesis by ribosomal frameshifting. In this study, an in vitro transcription and translation coupling system was used to demonstrate that the \*HBV\* \*core\* and \*pol\* proteins could be synthesized independently using the pregenome RNA template. The result has led us to design experiments to distinguish between the involvement of a termination-reinitiation, internal initiation, or leaky scanning mechanism in the \*pol\* protein synthesis. In vitro experiments were then carried out to measure the amount of \*pol\* proteins being synthesized from (i) the \*preC\* mRNA, which contained an extra AUG and seven more nucleotides at the 5'-end in comparison with the pregenome RNA; (ii) the pregenome RNA in the presence of various amounts of \*antisense\* RNA annealing to the 5'-end of the pregenome RNA; and (iii) the pregenome RNA with an additional hairpin structure located upstream of the \*C\* \*gene\*. Results indicated that the synthesis of both \*core\* and \*pol\* proteins was concomitantly reduced in these three conditions, which suggested that leaky scanning is the most probable mechanism for \*pol\* protein synthesis in vitro. To further verify the mechanism in vivo, experiments were performed to assay the activity of DNA \*polymerase\* in virions, which were obtained from hepatoma cells transfected by plasmids containing either a wild-type sequence (5'-GGCATGG-3') or an optimal initiation context (5'-ACCATGG-3') of the \*C\* \*gene\*. Transfection results showed that the plasmid-containing mutations of the \*C\* \*gene\* significantly decreased the DNA \*polymerase\* activity in virions. This observation supports our hypothesis that the leaky scanning model is involved in the synthesis of \*pol\* protein.

Abstract: Chronic infection with the hepatitis B virus (\*HBV\*) is a major health problem worldwide. The only established therapy is alpha-interferon with an efficacy of only 30-40% in highly selected patients. Major theoretical problems of therapeutical strategies against hepadnaviral infections are the limited immune response and the presence of covalently closed \*HBV\* DNA in the nucleus. Many nucleoside analogues and inhibitors of viral reverse transcriptases were tested in vitro and in vivo with transient effects and often severe side effects. Molecular therapeutic strategies include \*antisense\* DNA/RNA and ribozymes. In vitro \*antisense\* oligodeoxynucleotides could be shown to inhibit viral replication and gene expression in human hepatoma cell lines. In vivo an \*antisense\* oligodeoxynucleotide directed against the 5'-region of the preS gene of the duck hepatitis B virus inhibited the viral replication and gene expression in ducks. These results demonstrate the potential clinical use of \*antisense\* DNA/RNA as antiviral therapeutics.

Descriptors--Author Keywords: \*ANTISENSE\* OLIGODEOXYNUCLEOTIDES ; ANTIVIRAL SUBSTANCES ; DUCK HEPATITIS B VIRUS

Identifiers--KeyWords Plus: HEPATITIS-B VIRUS; HUMAN IMMUNODEFICIENCY VIRUS; ROUS-SARCOMA VIRUS; GENE-EXPRESSION; ADENINE-ARABINOSIDE; ANTIVIRAL ACTIVITY; SURFACE-ANTIGEN; DNA-\*POLYMERASE\*; PILOT TRIAL; \*HBV\* DNA

 PT DNA probes for detection of hepatitis B virus - in a soln.  
 phase  
 PT sandwich hybridisation assay  
 PS Claim 1; Page 62; 80pp; English.  
 CC A "15 x 3" amplified soln. phase nucleic acid sandwich  
 hybridisation  
 CC assay employs two multimers: (1) an amplifier probe having a  
 first  
 CC segment (A) that binds to HBV and a second segment (B) that  
 CC hybridises to (2) an amplifier multimer having a first segment  
 (B\*)  
 CC that hybridises to the segment (B) and fifteen iterations of  
 a  
 CC segment (C), wherein segment C hybridises to three labeled  
 CC oligonucleotides.  
 CC HBV amplifier probes are given in Q45786-824.  
 CC HBV capture probes are given in Q45825-833.  
 CC Each amplifier probe contained, in addition to the sequences  
 CC complementary to the HBV sequences, the 5' extension given in  
 CC Q45834, complementary to a segment of the amplifier multimer.  
 CC Each capture probe contained, in addition to the sequences  
 CC complementary to the HBV sequences, a downstream sequence  
 given  
 CC in Q45835, complementary to the DNA bound to the solid phase.

 PT Amplified nucleic-acid sandwich hybridisation assay - for  
 PT hepatitis B virus, using amplifier and capture probes.  
 PS Claim 2; Fig 9; 73pp; English.  
 CC The probe is one of a series designed from a computer  
 comparison of  
 CC the nine HBV subtypes reported in Gene Bank. All the probes  
 have  
 CC an extension at the 5' end. For probes used for amplification  
 this  
 CC comprises the 20mer LLA2C. (For the capture set the extension  
 is  
 CC XT1). The probes (subtype non-specific, SN) are of varying  
 length  
 CC and contain up to 32-fold degeneracy. They give improved  
 results  
 CC compared with those achieved in the HBV assa of EP-317077  
 (which  
 CC used adw specific probes), producing fewer false negatives.  
 The  
 CC probes are used in a soln. sandwich DNA hybridisation assay to  
 CC detect HBV DNA in an analyte.  
 CC See also Q06692-Q06740.

 PT New recombinant DNA molecules - useful in cloning and  
 expressing  
 PT DNA sequence coding for hepatitis B virus antigenic  
 poly:peptide  
 PT for use in vaccines  
 PS Claim 4; page 37-8; 42pp; English.  
 CC The DNA sequence encodes a polypeptide with hepatitis B virus  
 (HBV)  
 CC antigenicity. The polypeptide is an HBV surface or core  
 antigen. The  
 CC HBV antigens and genes can be obtd. in substantial amts. and  
 in  
 CC uncontaminated form, and may be used to produce vaccines. The  
 CC polypeptide may be used to diagnose HBV infection. The  
 polypeptide  
 CC may be expressed using a vector. HBV has a narrow host range  
 and  
 CC cannot be grown in tissue culture systems, so it has not  
 previously  
 CC been available in quantity.

 PT Treatment of hepatitis B and C, and associated carcinoma(s) -  
 PT using a vector construct directing the expression of part of  
 PT hepatitis B or C antigen  
 PS Example 2K; Page 38; 110pp; English.  
 CC The sequences given in Q47282-83 are primers which were used  
 in the  
 CC isolation of the ORF6 coding region of hepatitis B virus  
 (HBV).  
 CC The DNA which was used as a template in the PCR reaction, was  
 the  
 CC plasmid pAM6. The first primer corresponds to nucleotides  
 1844-1788  
 CC of the adw strain of HBV. The second primer corresponds to  
 the anti-  
 CC sense nucleotide sequence 1188-1240. A 687 bp amplification  
 product  
 CC was produced. This oligomer was ligated into the pCRII vector  
 and  
 CC designated pCRIIHB-ORF6. The isolated HBV ORF6 region may be  
 CC used in a method to induce potent class-I' restricted  
 protective and  
 CC therapeutic cytotoxic T-lymphocyte (CTL) response, and a  
 humoral  
 CC response for the treatment of hepatitis B and C infections, as  
 well  
 CC as hepatocellular carcinomas.
